

## **ENERCHRON® Makes Paint Obsolete!**

After undergoing 24 years of extensive research, development and testing this unbelievable product is now available to solve your painting problems. Helios Energy Products introduces ENERCHRON V-40® ([www.enerchron.com](http://www.enerchron.com)), a new type of interior/exterior building coating proven to be long lasting, energy efficient, graffiti and water resistant, fire retardant, and environmentally safe.

In Government tests it was reported that ENERCHRON® cut air conditioning run time by 50% to 90% when applied to exterior building surfaces. It is able to keep exterior surface temperatures to just a few degrees above air temperatures. In essence, coating with ENERCHRON® is like putting a building in the shade. Rooftop HVAC units coated with this material have seen 20 to 60 percent increases in cold air performance, which reduces cycle time, utility costs and extends unit life.

ENERCHRON® has increased lighting efficiency in Dept of Energy tests for day lighting by 50% to 85% and customers claim that they “don’t need any interior lighting during the day at all”. In internal testing for heating efficiency ENERCHRON V-40® has increased heater efficiency by 30%.

Maintenance costs are greatly reduced because it completely shields surfaces from the sun and the damaging effects of thermal shock. ENERCHRON V-40® is also incredibly strong, and is resistant to even the strongest sand storms. To date, there are buildings coated with ENERCHRON® 15 years ago, which still look freshly painted (This is one very important benefit to the environment because by reducing repetitive painting over the years, means less VOC’s are emitted into the environment). In tests by the California South Coast Air Quality Management District it was reported that ENERCHRON®’s VOC’s were rated 60 g/l, which means it is 4.2 times less toxic than typical latex house paint.

Indelible marker, spray paint, grease, crayons, dirt and more can be washed off surfaces with a nylon scrub pad and soap and water. ENERCHRON V-40® ability to be easily cleaned means you don’t have to repaint every time your building gets dirty. ENERCHRON® is Class “A” fire retardant coating. It carbonizes at 2500°F and has made the difference in saving buildings during a fire.

ENERCHRON V-40® is applied like regular paint (sprayed, rolled or brushed) and can be used on interior, exterior walls and roof surfaces (on approval).

The best news about ENERCHRON V-40® is that it is priced competitively with latex house paint at equal dry film thickness levels, which means that you have nothing to lose and everything to gain by purchasing ENERCHRON®. We know that this all sounds too good to be true, so please take the time to go to <http://www.enerchron.com> to find out for you.
